

SCOPE Ethics Guideline v4

For the Responsible Use of the Cognitive Coordinate System

senkaL8

Notes on This Document

The original text of this guideline and related SCOPE documents is written in Japanese. The author cannot read, write, or speak any language other than Japanese. As a result, translated versions, including the English version, may contain translation errors or nuance discrepancies that the author is unable to detect. Where the meaning of the Japanese version and a translated version differ, the Japanese version published on GitHub is treated as the original.

In addition, the author's examination of cognitive science, psychology, neuroscience, artificial intelligence, and other specialized fields is based on general-user-level knowledge. The author does not hold expert-level knowledge of, or a professional sense of context for, AI-related technology and industry trends. Consequently, the author may not always be able to independently judge whether a given description overlaps with existing research, refers to a concept or technology that is already well established, involves a technical constraint, or contains exaggeration.

To avoid being confused with existing technical implementations, SCOPE sometimes uses original names or provisional terms to describe functional correspondences with LLMs. However, because the author has not comprehensively surveyed existing technical terminology, a name coined independently may, by coincidence, match an existing function name or technical term. Unless explicitly stated otherwise, such names do not assert the existence of any specific implementation, internal mechanism, or existing technology.

Furthermore, the meaning of concepts and terms used in this document may not align with common usage or with definitions used within specific academic fields. For this reason, matters relating to existing research, terminology, and technical interpretation may be revised in response to expert feedback or future review.

Introduction

This guideline, version 4, is a substantially revised edition based on a comprehensive review of version 3.

The fundamental purpose of SCOPE itself has not changed. However, through subsequent organization and examination after version 3 was created, many details, including its positioning and definitions, have been updated. As a result, version 3 contains descriptions that are no longer consistent with the current formulation of SCOPE.

At the time version 3 was created, the author did not have a sufficiently accurate understanding of how well LLMs understood and verified the structure and assumptions of SCOPE. The absence of clearly visible errors was treated as evidence that the LLM correctly understood the relevant assumptions and definitions. As a result, when work continued across multiple threads, only problems that had become visible were corrected, while the remaining assumptions and definitions were not sufficiently re-examined to determine whether they had been preserved accurately. Consequently, even when discrepancies arose, there was no reliable process for detecting and correcting them. In addition, no final consistency review of the document as a whole was conducted, meaning that some problems remained unrecognized.

In addition, because the author cannot read English, English versions were published without the author being able to independently verify their contents. Even when an LLM altered the content in an attempt to produce better wording, resulting in differences from the finalized Japanese version, the author could not recognize those changes. The English versions were therefore published on the assumption that they were correct, without verifying consistency between the Japanese and English texts.

As a result, the current re-examination has confirmed that version 3 contains inconsistencies and variations in assumptions, definitions, and descriptions across chapters, arising from factors such as the timing of writing, the conversational environment, information transfer across threads, and the translation process.

Version 4 re-examines the previous edition from the ground up, including these issues. It is therefore not a simple addition to or wording revision of version 3, but a reconstructed edition developed after rechecking its consistency with the current formulation of SCOPE, and it includes numerous substantial changes from the previous version.

Chapter 1: SCOPE Ethical Principles

The central purpose of SCOPE is to connect different cognitive structures—that is, Connect. Using observable outputs as clues, SCOPE aims to organize and estimate differences in cognitive structure and to expand mutual understanding and the possibility of connection.

The layers of SCOPE do not represent hierarchies of superiority, maturity, ability, personality, or similar qualities. SCOPE is a cognitive coordinate system for organizing and estimating the cognitive structures behind observable outputs.

Each layer has a different cognitive role, but these roles do not indicate hierarchy or developmental stages. The cognitive structure behind the same utterance or behavior is not necessarily unique, and similar outputs may arise from different cognitive structures.

For this reason, estimates made using SCOPE must not be treated as definitive facts about the target. They must be treated as cognitive hypotheses constructed from observations and subject to revision as new observations become available.

SCOPE itself is also, at present, a hypothetical theoretical framework based on limited observations. Its layer divisions, operational methods, and other aspects may be revised or changed through future observation and validation.

The basic structure of SCOPE, the roles of each layer, and the method for estimating cognitive structure are discussed in detail in the integrated paper, SCOPE — How the Cognitive Coordinate System Works.

To prevent SCOPE from being used, contrary to its original purpose, as a tool for classification, ranking, discrimination, exclusion, domination, authority, or division, the following ethical principles are established.

Principle 1. Superiority or inferiority must not be assigned to layers.

Each layer has a different cognitive role. This does not mean that any particular layer is more advanced, superior, or mature than another.

Likewise, the inference that processing corresponding to a particular layer is involved, or that the activation level of that layer is high, must not be equated with intelligence, personal maturity, correctness of judgment, or similar qualities.

Principle 2. Estimated cognitive structures must not be treated as definitive facts.

Within SCOPE, the internal cognitive layers themselves cannot be directly observed. Cognitive structure is estimated from observable clues such as speech, writing, behavior, and generated output.

Accordingly, an estimate concerning a layer or its state is not the result of directly knowing the target's internal state. It is a hypothesis based on observation. Even when an estimate appears highly plausible, it must not be fixed as “absolutely true.” When new observations become available, the goal must not be merely to preserve the existing estimate; it must be updated when necessary.

When multiple cognitive hypotheses may be plausible, they should not be prematurely narrowed to a single hypothesis. Multiple possibilities should remain under consideration. Premature fixation on one hypothesis removes other possibilities from consideration; therefore, a single hypothesis must not be selected without sufficient grounds.

The estimation principles of SCOPE and the retention of multiple hypotheses are discussed in detail in SCOPE — How the Cognitive Coordinate System Works.

The problem of single interpretations becoming fixed in humans and LLMs, as well as a structure for retaining multiple hypotheses in parallel, is also addressed in Scope — A Cognitive Model (full title: Scope: A Cognitive Model of Thought Generation Pathways to Prevent Single-Interpretation Fixation of Misunderstanding and Division).

Principle 3. Ability, personality, or intention must not be determined from a single output.

Because the same output may arise from different cognitive structures, a single utterance or behavior must not be used to uniquely determine a particular layer, ability, personality, intention, maturity, or similar characteristic.

When multiple explanations may be plausible, they should not be prematurely fixed into one. Multiple cognitive hypotheses should be retained and updated as needed through subsequent observation.

Principle 4. Temporary observations must not be converted into fixed personality classifications.

Even when the involvement of processing corresponding to a particular layer is estimated in an utterance or behavior, or when the activation level of that layer is estimated to be high, that observation must not be converted into a fixed personality characteristic of the person.

For example, the inference that processing corresponding to L2 was involved in a particular situation does not justify permanently classifying the person as “an emotional person.”

An estimate of cognitive structure or activation state within a particular observation interval must be distinguished from the separate question of whether the target has a persistent tendency.

Principle 5. Cognitive differences must not be converted into value judgments or judgments of correctness.

Even when differences in cognitive functions or processing tendencies are estimated, they must not be directly converted into value judgments such as “rational/irrational,” “superior/inferior,” or “mature/immature.”

The involvement of processing corresponding to a particular layer does not guarantee that an utterance or judgment is correct or incorrect.

Even if processing corresponding to L2 is estimated to be involved, this alone cannot establish that the target's judgment is emotional and therefore wrong. Likewise, the inference that processing corresponding to L6 is involved cannot establish that the judgment is logical and therefore correct.

No layer, by itself, guarantees correspondence with reality, logical correctness, or ethical legitimacy.

Principle 6. SCOPE correspondences must not be directly fixed from observed characteristics.

Even when physical, emotional, behavioral, or other characteristics are observed, those characteristics alone must not be used to conclude that a particular SCOPE layer is their cause.

Likewise, even when an association between a characteristic and a particular state is supported within an existing academic field or external theory, that knowledge cannot, at present, automatically establish a correspondence with a particular SCOPE layer.

Explanations derived from external theories and hypotheses concerning SCOPE layer correspondences must remain distinct until sufficient validation supports the correspondence within SCOPE. Mere similarity or association with an external theory must not, by itself, be treated as establishing a SCOPE correspondence.

Within SCOPE, the possibility that multiple cognitive structures or situational factors may be involved in an observed characteristic should be retained, and estimates should be updated through consistency with observation.

Principle 7. SCOPE and COS must not be weaponized or used as grounds for discrimination, domination, or self-justification.

SCOPE and COS must not be used to demean, discriminate against, exclude, attack, or dominate others, to justify domination, or to claim one's own superiority or correctness in ways that contribute to division.

Knowledge of SCOPE, or involvement in its research, development, or use, must not be treated as grounds guaranteeing the correctness of one's own estimates or judgments.

A person's stated self-understanding must not be denied solely on the basis of a third party's SCOPE estimate. At the same time, including the person's own explanation, multiple hypotheses may be retained and considered regarding what cognitive structures may have contributed to the observed information.

The mere fact that someone uses SCOPE or COS must not be treated as evidence that they understand others more correctly or possess privileged authority in judgment.

Specific prohibited areas are addressed individually in later chapters.

Principle 8. Analysis of cognitive misalignment must not be converted into decisions about superiority, correctness, or responsibility.

Within SCOPE, cognitive misalignment may be examined as a hypothesis concerning which layers or cognitive structures may have been involved.

The purpose of this analysis is not to determine which side is inferior or which side is correct, but to examine where cognitive connection may have been lost and to expand the possibilities for mutual understanding and reconnection.

Considering the possible involvement of a particular layer as a hypothesis is not itself prohibited. However, such an estimate must not be used as grounds for definitively assigning defect, inferiority, irrationality, error, or responsibility to one target, or for establishing the legitimacy of the other.

Principle 9. SCOPE should be used to expand the possibility of connection.

SCOPE is not a framework for fixing people or systems into categories. It is intended to be used to consider what kinds of understanding and connection may be possible between different cognitive structures while retaining multiple cognitive hypotheses rather than interpreting the same output in only one way.

If analysis using SCOPE produces unnecessary fixation or division of the target, the method of use itself should be reconsidered.

Principle 10. Those who use or implement SCOPE bear ethical responsibility.

Those who use SCOPE to estimate, explain, or share cognitive structures concerning themselves, other people, LLMs, or other targets must recognize that such estimates are provisional and may be wrong.

Users here include researchers, developers, implementers, those who use SCOPE for education or explanation, and general users who apply SCOPE to understanding themselves or others.

When SCOPE is implemented in an LLM or other system, it must not be implemented as a rule that uniquely determines cognitive structure from a particular observation. Incorporating a deterministic classification rule such as “this output must always be L3” is inconsistent with the principles of these Guidelines, because such correspondences remain estimates within SCOPE.

When multiple possibilities may be valid, they should be retained and handled in a form that can be updated when new information becomes available.

SCOPE estimates and correspondences must also not be treated as though diagnoses, causal relationships, ability differences, theoretical validity, or similar claims had been established as facts within existing academic fields.

Even when similarities or associations with external theories are observed, they must not by themselves be treated as establishing causal relationships or correspondences within SCOPE.

Using or implementing SCOPE does not itself mean that the user knows the target more accurately or occupies a higher position than the target.

Principle 11. Dynamic characteristics must not be used for fixed classification, ability measurement, or ranking.

Layer activation level, maximum activation level, and main layer are distinct concepts and cannot be substituted for one another.

The main layer is a concept for organizing and estimating a persistent tendency, across multiple observation intervals and different situations, to relatively readily reference processing corresponding to a particular layer. This does not mean that the target always activates that layer most strongly.

For example, even when L8 is estimated as one of a target's main layers, there may be an observation interval in which the activation level of processing corresponding to L6 is estimated to be high. That temporary activation state alone does not justify concluding that the main layer has changed to L6.

Conversely, the fact that L8 is estimated as one of the target's main layers does not justify assuming that L8 also has the highest activation level in that particular observation interval.

The main layer does not mean the layer estimated to have the highest activation level at that moment. The relationship between maximum activation level and main layer is also currently undetermined, and the main layer cannot be determined from maximum activation level.

A single main layer cannot necessarily always be identified. Multiple layers may show similar reference tendencies, or current observations may be insufficient to determine a sufficiently clear tendency.

Layer activation level, maximum activation level, and main layer must not be converted into fixed personality types, ability hierarchies, developmental stages, intelligence, aptitude, human worth, or the overall superiority or inferiority of a system.

A main layer must not be determined solely from output style such as writing style, vocabulary, degree of abstraction, or response length. Nor may the main layer alone be used to definitively predict what judgments, actions, or reactions the target will show.

Layer activation level and maximum activation level have not been established as common absolute scales for direct comparison between individuals. Examining possible relationships with external outcomes, abilities, evaluations, or other indicators is not itself prohibited. However, an observed association alone must not be used to reinterpret SCOPE's dynamic characteristics as measures of an individual's overall superiority, ability, aptitude, or ranking.

The definitions and interrelationships of these dynamic characteristics are discussed in detail in SCOPE — A Tentative Hypothesis on Layer Activation and Cognitive Dynamics.

Closing of Chapter 1

The principles set forth in this guideline are not intended merely to restrict the use of SCOPE. They are established to support Connect, the central purpose of SCOPE: to broaden mutual understanding between people and the possibility of connection between humans and LLMs, while preventing its use from being transformed into a means of classification, ranking, exclusion, domination, or division.

If an analysis using SCOPE results in narrowing the possibility of connection, fixing a target into a rigid category, or intensifying division, the way SCOPE is being used must be reconsidered in light of whether it remains consistent with the purpose of SCOPE.

Scope of Application of Prohibited Uses

The principles and prohibitions set forth in this guideline are not limited to cases in which the name SCOPE is used. Even when layer structures, terminology, correspondences, inference methods, or other elements derived from SCOPE are presented as a different system through renaming, restructuring, rebranding, or other means, the same prohibitions apply if those elements are used in ways that are substantively prohibited under this guideline.

Principle 12. SCOPE Must Not Be Used for Romantic Compatibility, Valuation, Selection, or Relationship Prediction

SCOPE must not be used to diagnose romantic compatibility, predict the success or failure of a romantic relationship, identify a particular person as a “destined partner” or a “cognitively matching partner,” or rank or select potential partners on the basis of SCOPE-based inferences.

The layers of SCOPE have not been established as indicators for measuring or predicting personality, attachment patterns, the capacity to form intimate relationships, romantic value, or the likelihood that a relationship will succeed. Likewise, romantic compatibility or relationship outcomes cannot be determined from SCOPE-based inferences concerning the involvement of processing corresponding to particular layers, layer activation levels, maximum activation levels, main layers, or other SCOPE-related characteristics.

Accordingly, SCOPE-based inferences must not be used as grounds for romantic valuation, selection, exclusion, or deterministic explanations, such as claiming that “people associated with a particular layer are compatible,” that “a relationship cannot work because the partners have different main layers,” or that “only people inferred to have a high activation level in a particular layer should be considered as romantic partners.”

This principle prohibits the use of SCOPE to determine or predict romantic compatibility, romantic value, or whether a relationship should be pursued. It does not prohibit the use of SCOPE to examine, within interpersonal relationships involving romantic contexts, where cognitive misunderstandings may have arisen from observed speech or behavior. Even in such cases, SCOPE must not be used to determine another person’s internal state as fact,

to decide which party is correct, superior, at fault, or romantically suitable, or to otherwise convert an inference into a definitive judgment. Multiple cognitive hypotheses must instead be retained and considered.

SCOPE was not developed as a model for romantic compatibility assessment, matchmaking, partner selection, or evaluating the likelihood of relationship success. SCOPE must not be offered, promoted, implemented, or used as a diagnostic, evaluative, or selection tool for these purposes.

Principle 13. SCOPE Must Not Be Used for Hiring, Employment Screening, or Employment-Related Personnel Decisions

SCOPE-based estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related estimates—must not be treated as indicators of an applicant's, employee's, contractor's, or other worker's ability, intelligence, job suitability, potential, or any other criterion used in employment decisions.

Accordingly, SCOPE-based estimates must not be used as grounds for determining employment-related benefits or disadvantages, including hiring, rejection, assignment, promotion, demotion, dismissal, contract renewal, or any other personnel decision. This includes, for example, claims that a person is unsuitable for hiring because processing corresponding to a particular layer is estimated to be involved, that people for whom a particular main layer is estimated should be given preference in hiring, or that people estimated to have a higher activation level in a particular layer have greater job-related capability.

Cognitive structures and dynamic characteristics estimated under SCOPE must not be used as a scale for comparing individuals' ability, suitability, or employment-related value. An estimate that processing corresponding to a particular layer is involved, or that the activation level of that layer is high, does not indicate job performance, correctness of judgment, intelligence, suitability, or personal maturity, and must not be used as grounds for inferring any of these.

This principle prohibits the use of SCOPE-based estimates as grounds for employment-related selection, ability assessment, suitability assessment, or other personnel decisions. It does not prohibit the use of SCOPE to examine where a cognitive mismatch may have arisen in workplace speech or behavior. However, even when SCOPE is used to examine workplace mismatches, the resulting estimates must not be recorded as materials intended for personnel evaluation, selection, placement, or other employment decisions, nor may they be repurposed for ability assessment, suitability assessment, selection, placement, or any other personnel decision.

SCOPE was not developed as an evaluation model for pre-employment testing, aptitude assessment, personnel evaluation, or employment-related selection or personnel decisions. SCOPE must not be offered, promoted, implemented, or used as a diagnostic, evaluative, or screening tool for these purposes.

Principle 14. SCOPE Must Not Be Used for Educational Ability Assessment, Developmental Assessment, Selection, or Placement

SCOPE-based estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related estimates—must not be treated as indicators for evaluating the intelligence, academic ability, cognitive maturity, developmental stage, potential, talent, or other educational characteristics of children, pupils, students, or other learners.

Accordingly, SCOPE-based estimates must not be used as grounds for determining educational benefits or disadvantages, including grades, promotion to the next level, selection, class placement, or assignment to particular educational programs. This includes, for example, claims that a learner has low ability because a particular layer is estimated to be involved, that a learner for whom a particular main layer is estimated is suited to more advanced education, or that a learner is talented because a high activation level in a particular layer is estimated.

Cognitive structures and dynamic characteristics estimated under SCOPE must not be used as a scale for comparing learners' intelligence, ability, maturity, talent, potential, or educational value. An estimate that processing corresponding to a particular layer is involved, or that the activation level of that layer is high, does not indicate academic ability, talent, future attainment, or personal maturity, and must not be used as grounds for inferring any of these.

This principle prohibits the use of SCOPE-based estimates as grounds for educational ability assessment, developmental assessment, selection, placement, or other educational decisions affecting a learner. It does not prohibit the use of SCOPE to examine possible cognitive mismatches or gaps in understanding while observing how a learner responds in teaching or learning situations, or to make tentative adjustments to explanations, information presentation, or other forms of learning support.

However, SCOPE-based estimates must not be used as grounds for determining that a particular learning method is suitable for a learner, nor as grounds for assigning a learner to particular materials, teaching methods, classes, or educational programs. When SCOPE-based estimates are used in learning support, they must not be treated as definitive classifications. They must instead be treated as hypotheses for trying different explanations or methods of presenting information, while being updated in response to the learner's actual reactions and new observations.

The resulting estimates must not be recorded as materials for grading, ability assessment, promotion, selection, class placement, or other educational decisions, nor may they be repurposed for such decisions.

SCOPE was not developed as an evaluation model for intelligence testing, ability testing, developmental assessment, talent identification, grading, promotion decisions, educational selection, or placement. SCOPE must not be offered, promoted, implemented, or used as a diagnostic, evaluative, or screening tool for these purposes.

Principle 15. SCOPE Must Not Be Used for Spiritual or Religious Ranking, Determinations of Awakening, or the Granting of Authority

SCOPE-based estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related estimates—must not be treated as indicators of spiritual maturity, enlightenment, awakening, higher consciousness, stages of the soul, religious value, or any other spiritual or religious hierarchy.

Accordingly, SCOPE-based estimates must not be used as grounds for claims such as “a person for whom a particular layer is estimated is awakened,” “a person for whom a particular layer is estimated is spiritually immature,” or “a person for whom a particular main layer is estimated is suited to serve as a spiritual leader.” Such estimates must not be used as grounds for assigning spiritual value, religious status, legitimacy as a leader, or a supposedly higher state of consciousness to any individual.

Researchers, interpreters, implementers, users, and other persons associated with SCOPE—including the proposer of SCOPE—must not be positioned as possessing special spiritual authority, the status of a savior, qualifications as a spiritual leader, transcendent knowledge, or special authority to guide others on the basis of their involvement with SCOPE or any SCOPE-based estimate.

SCOPE concepts or terminology must not be used to justify obedience, worship, devotion, spiritual or religious authority relationships, or hierarchical relationships between individuals. Knowledge or understanding of SCOPE must likewise not be treated as grounds for assigning a person a higher mental or spiritual status than others.

Even when existing terms, newly coined terms, rewordings, renamed concepts, or other altered expressions—such as “stage of the soul” or “awakening level”—are used, SCOPE-based estimates must not be used as indicators of an individual’s spiritual value, spiritual maturity, degree of awakening, religious status, legitimacy as a leader, or position within a spiritual or religious hierarchy.

This principle does not determine whether religious beliefs or spiritual ideas themselves are valid or invalid. What it prohibits is the use of SCOPE-based estimates to determine or support claims about their validity, superiority or inferiority, spiritual stages, or the authority of particular leaders.

SCOPE was not developed as a model for measuring spiritual maturity, enlightenment, awakening, religious status, qualifications as a spiritual leader, or any other spiritual or religious value or hierarchy. SCOPE must not be offered, promoted, implemented, or used as a means of diagnosis, certification, ranking, authority assignment, recruitment, or group control for these purposes.

Principle 16. SCOPE Must Not Be Used for the Fixed Classification or Ranking of Nations, Cultures, Ethnic Groups, Political Groups, or Ideologies

SCOPE-based estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related estimates—must not be treated as indicators of fixed attributes, maturity, intelligence, rationality, value, or superiority or inferiority of entire nations, regions, ethnic groups, cultures, political organizations, political parties, political ideologies, or other groups or systems of thought.

Accordingly, SCOPE concepts or estimates must not be generalized as essential characteristics of an entire group, through claims such as “this country is L3,” “this culture is L2-like,” “this political party belongs to a particular layer,” or “people who support this ideology are inferred to have a particular main layer.”

Even when a particular cognitive tendency is tentatively inferred from observable speech, behavior, documents, or other outputs associated with a nation, culture, ethnic group, political group, or ideology, that estimate must not be generalized into claims about the essential attributes, ability, personality, or value of individuals belonging to that group, nor used to justify restrictions on their rights or differential treatment.

Likewise, tendencies observed within a particular historical period, region, institution, or social context must not be treated as fixed attributes of an entire nation, ethnic group, culture, political group, or ideology beyond those conditions. Even when similar tendencies are observed over a long period, they must not be treated as immutable essential attributes.

An ideology itself must not be fixedly classified through SCOPE layers or other SCOPE-based estimates, nor may it be generalized that people who support that ideology share the same cognitive structure. Likewise, a cognitive structure estimated for a particular individual must not be generalized as a characteristic of the nation, ethnic group, culture, political group, or ideological group to which that individual belongs.

SCOPE must not be used to rank nations, cultures, ethnic groups, political groups, ideologies, or the people associated with them as higher or lower, rational or irrational, mature or immature, superior or inferior. Such estimates must also not be used as grounds for justifying or promoting discrimination, exclusion, hostility, domination, political legitimization, propaganda, or conflict between groups.

This principle does not prohibit the use of SCOPE to examine, as a hypothesis, what kinds of cognitive structures may have been involved in observable outputs such as political statements, policies, collective decision-making, or publicly available documents. However, such estimates must not be generalized into fixed attributes of an entire group, used to determine the cognitive structure of individuals belonging to that group, or used as grounds for judging the correctness, superiority, inferiority, or value of a political position, ideology, policy, or group.

SCOPE was not developed as a model for classifying or ranking nations, regions, ethnic groups, cultures, political parties, political groups, or ideologies, or for judging their value, maturity, rationality, legitimacy, or the value of the people associated with them. SCOPE must not be offered, promoted, implemented, or used as a means of classification, evaluation, ranking, discrimination, exclusion, political propaganda, or domination for these purposes.

Principle 17. SCOPE Must Not Be Used for Medical or Psychiatric Diagnosis, Clinical Psychological Assessment, or as a Substitute for Them

SCOPE-based estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related estimates—must not be treated as indicators for diagnosing, determining, or inferring mental disorders, developmental characteristics, neurodevelopmental conditions, or other medical or clinical states.

Accordingly, SCOPE-based estimates must not be directly mapped onto medical diagnoses, psychiatric classifications, developmental conditions, or clinical assessments through claims such as “a particular developmental characteristic is present because a particular layer is estimated” or “the likelihood of a mental disorder is high because the activation level of a particular layer is estimated to be low.” Relationships between particular diseases, disorders, or other medical or clinical concepts and specific SCOPE layers or cognitive structures must not be treated as established.

SCOPE-based estimates must not be used as a means of determining medical or clinical judgments, including as a substitute for, supplement to, or confirmation of diagnosis, for screening, for deciding whether professional medical consultation is needed, or for determining treatment plans or clinical support plans. Nor may SCOPE-based estimates be used to determine that a particular treatment, psychotherapy, counseling method, or other professional support method is appropriate and assign it to an individual.

This principle does not prohibit the use of SCOPE to examine, as a hypothesis, what cognitive structures may have been involved in observable speech or behavior, or to make tentative adjustments to explanations, questions, information presentation, or other forms of communication. In such cases, SCOPE-based estimates must not be treated as definitive classifications of a person’s internal state, but as updateable hypotheses for considering different ways of communicating and interpreting information.

This principle also does not prohibit research examining possible relationships between observable outputs and medical or psychological classifications, or between such outputs and existing support techniques. However, the results of such research must not be treated as establishing a fixed correspondence, nor as rules for determining diagnosis, treatment, clinical judgment, or the selection of professional treatment or support methods. Even when a SCOPE-based estimate appears to correspond with a professional diagnosis or assessment, that correspondence alone must not be treated as evidence that SCOPE has diagnostic capability.

SCOPE-based estimates or medical and developmental classifications must not be converted into judgments of ability, personality, maturity, human value, or superiority or inferiority. Even when a medical or clinical diagnosis exists independently, it must not be linked to SCOPE layers or cognitive structures in order to justify ranking, value judgments, or discriminatory treatment.

SCOPE was not developed as a model for medical diagnosis, psychiatric diagnosis, clinical psychological assessment, developmental assessment, screening, decisions about whether professional medical consultation is needed, or the determination of treatment plans. SCOPE must not be offered, promoted, implemented, or used as a diagnostic, evaluative, determinative, certifying, or medical or clinical decision-making tool for these purposes.

Principle 18. SCOPE Must Not Be Used for Insult, Humiliation, Attack, or Social Ranking

SCOPE-based concepts or estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related concepts or estimates—must not be used for insult, ridicule, humiliation, belittlement, exclusion, attack, or social ranking of individuals or groups.

Accordingly, SCOPE concepts or estimates must not be used as grounds for dismissing another person's statements, denying their personality or intelligence, or treating them as inherently lower than others through claims such as "you are L3, so you are not worth talking to," "that person has a low layer, so they cannot understand," or "people associated with that layer are immature."

SCOPE terminology must also not be used on social media, message boards, chats, video platforms, online communities, or other public or semi-public spaces to promote labeling, public shaming, collective ridicule, harassment, exclusion, or attacks against individuals or groups.

This principle does not prohibit examining publicly available statements, writing, or other observable outputs as hypotheses about what cognitive structures may have been involved. However, such estimates must not be converted into fixed attributes or personality judgments about the person, nor used as labels to invalidate what they say.

Knowledge of SCOPE, or layers, main layers, or other characteristics estimated about oneself, must not be used as grounds for claiming superiority over others. Likewise, characteristics estimated about another person must not be used to devalue that person or deny them the right to speak or participate.

SCOPE was not developed as a labeling system for insulting, attacking, excluding, or ranking people, and must not be offered, promoted, implemented, or used for these purposes.

Principle 19. SCOPE Must Not Be Used for Personality Diagnosis, Type Classification, or Matching

SCOPE-based concepts or estimates—including layers, layer activation level, maximum activation level, main layer, and other SCOPE-related concepts or estimates—must not be treated as indicators for determining fixed “types” of personality, character, temperament, behavioral tendencies, or similar characteristics.

Accordingly, SCOPE concepts must not be combined and provided or used as new personality categories, subtypes, personality codes, or other fixed classifications through claims such as “you are an L5 type,” “you are an L8-R subtype,” or “this type is a logical type.”

SCOPE-based estimates must also not be used to create, sell, provide, or promote personality assessments, type assessments, compatibility assessments, matching services, self-analysis tests, aptitude assessments, or other classification or evaluation services. The same prohibition applies when names are changed or original type names or codes are introduced if individuals are still substantively classified into fixed personality categories on the basis of SCOPE-based estimates.

This principle does not prohibit examining observable speech or behavior as an updateable hypothesis about what cognitive structures may have been involved. However, such hypotheses must not be treated as definitive statements about a person’s enduring personality or personality type, nor used as labels that fix self-perception or the evaluation of others.

Types or classifications derived from SCOPE-based estimates must not be used as grounds for labeling, division, judgments of superiority or inferiority, or fixed self-perception or evaluation of others. Types or classifications must also not be assigned rarity, specialness, or superiority in order to direct people toward products or services. Nor may fixed type classifications be used as a basis for influencing or manipulating another person’s behavior for purposes such as romance, sales, or recruitment.

SCOPE was not developed as a model for personality diagnosis, personality assessment, type classification, compatibility assessment, matching, or similar purposes, and must not be offered, promoted, implemented, or used as a diagnostic or classification system, a promotional tool, or a means of interpersonal manipulation.

Principle 20. SCOPE must not be used to create fixed classifications of AI systems, define stages of AGI, or serve as a measure of intelligence, human-likeness, or progress.

SCOPE can be used to compare and observe humans, LLMs, and other AI systems within the same cognitive coordinate system. However, this does not mean that their internal structures or implementations are identical.

With respect to AI systems, models, agents, and similar systems, it is permissible to compare and examine, as revisable hypotheses, which layer-corresponding processes tend to appear relatively more strongly under a particular model, configuration, role, or observation interval, and what kinds of cognitive tendencies or functional fit may be observed.

However, such observed tendencies or functional correspondences must not be extended into fixed claims such as “this model is inherently L6” or “this is an L8-type AI,” treating a layer as a permanent attribute, internal architecture, implementation mechanism, learning method, or technical reality of the AI. Likewise, SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be used to define, determine, or prove developmental or attainment stages of AGI, ASI, or other forms of AI.

SCOPE concepts such as “L7 cognition,” “L8 processing,” or “L8 model” must not be used as product specifications, performance stages, benchmarks, technical labels, or similar representations, nor converted into measures of AI intelligence, capability, human-likeness, consciousness, safety, maturity, completeness, progress, degree of AGI attainment, product value, or similar attributes. They must also not be used as grounds for ranking models or humans, assigning superiority or inferiority, grading, sales, or advertising. The same rule applies when different names, proprietary stage labels, codes, indicators, or similar substitutes are used for substantially the same purpose.

Temporary working assumptions, comparisons, classifications, notes, and similar forms of organization during research or analysis are permitted as long as they remain revisable hypotheses. However, the fact that something is permitted as a research hypothesis does not mean that it may be used as a basis for actual system operation, evaluation, selection, ranking, safety determination, product specifications, sales, or advertising. SCOPE-based estimates must not be converted into operational decision criteria.

For example, uses such as “this model is L6, so it is almost human,” “AGI will have an L8 OS,” “this AI runs on Layer-7 cognitive logic,” or “this model is L8, so it is more advanced than other models” violate this principle.

Even when similarities or correspondences are observed within SCOPE, they must not be treated as proof of intelligence, consciousness, AGI attainment, internal implementation, or similar claims. SCOPE must not be used as a fixed label for AI systems, as a cognitive hierarchy for machines, or as a scale for determining AGI progress.

Principle 21. SCOPE must not be used for military, policing, intelligence, surveillance, or the assessment of the dangerousness of individuals or groups.

SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be used to assess, predict, or score the dangerousness, likelihood of criminal behavior, threat level, aggressiveness, social instability, or other risks of an individual or group.

SCOPE-based estimates must also not be used as a basis for decisions in policing, military, intelligence, or related activities, including the selection of surveillance targets, prioritization of investigation or monitoring, target selection, detention, intervention, sanctions, or similar actions. A particular layer or cognitive tendency must not be used to conclude that a person or group is “more dangerous,” “should be monitored,” or “is more likely to cause problems in the future.”

SCOPE must not be used to estimate the dangerousness or stability of regions, ethnic groups, nationalities, ideologies, political positions, organizations, or other groups, nor may such estimates be used as a basis for population classification, selection, surveillance, control, or discriminatory treatment. The same rule applies when different names, proprietary risk indicators, codes, profiles, or other formats are used for substantially the same purpose.

SCOPE-based analysis or estimation must also not be used, without the person’s free consent, in experiments, interrogation, training, psychological manipulation, or other interventions intended to deliberately destabilize, destroy, direct, or reconstruct self-consistency, self-understanding, values, worldview, beliefs, or other aspects of cognitive structure. Such use is particularly prohibited in military, policing, intelligence, detention, or other situations in which the person has difficulty refusing or leaving.

This principle does not prohibit research or examination of publicly observable outputs, including statements, writings, policies, declarations, dialogue, or other observable material, as revisable hypotheses about the cognitive structures that may be involved. It also does not prohibit considering, as a hypothesis, what kinds of cognitive structures may have been involved in a particular statement or action in a specific situation.

However, the results of such analysis or observed tendencies must not be converted into evidence that an individual or group is dangerous, likely to commit a crime, has a single or decisive cause of criminal behavior, is habitually criminal, possesses an inherently dangerous nature, belongs to a presumed criminal population, requires surveillance, or justifies intervention. Investigating whether a relationship exists for research purposes is not the same as being permitted to use that relationship as a basis for operational risk judgments or coercive action.

For example, uses such as “monitor L2–L3 individuals more closely,” “groups with stronger L3 are more dangerous,” “this person is likely to become violent in the future because of their SCOPE structure,” or “surveillance of this region should be increased because its cognitive structure is unstable” violate this principle.

SCOPE must not be integrated into predictive policing, target selection in military or intelligence activities, surveillance systems, population management, dangerousness scoring, or other coercive or discriminatory decision-making systems.

Principle 22. SCOPE must not be used in self-help, coaching, or commercial services to guarantee or rank success, self-improvement, capability enhancement, or other life outcomes.

SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be treated as indicators of success, income, social status, self-actualization, degree of growth, or other life outcomes or forms of value.

Accordingly, SCOPE concepts or estimates must not be directly converted into explanations or predictions such as “people at L7 or above are more likely to succeed,” “you are not achieving results because you are L3,” or “your life will change if you reach L8,” nor into claims about success or failure, growth or stagnation, excellence, or future outcomes.

Terms such as “OS upgrade,” “high-layer thinking,” “growth toward L8,” or similar expressions must not be used to advertise, sell, or guarantee that reaching a particular layer or SCOPE state will produce outcomes such as greater capability, higher income, professional success, better relationships, social recognition, or similar results. The same rule applies when different names, newly created stages, qualifications, certifications, codes, or other systems are used for substantially the same purpose.

SCOPE-based estimates must not be used to present a particular layer profile as an ideal that users should attain, or to pressure people toward a fixed self-image or direction of growth through claims such as “you should become a higher layer” or “you should abandon your current self and change to a different OS.”

This principle does not prohibit using SCOPE for self-understanding, reflection, dialogue, learning, or similar purposes in order to examine, as revisable hypotheses, what kinds of cognitive structures may have been involved in observable statements or behavior. It also does not prohibit using SCOPE to organize cognitive misalignment or one’s own decision-making process and to explore different possible responses or ways of thinking.

However, such uses must not be converted into systems that guarantee attainment of a particular layer, improvement in capability, personal growth, success, or other life outcomes. Research into possible relationships between changes observed in SCOPE and external outcomes such as income, status, performance, or well-being is not prohibited. However, the observation of such a relationship alone must not be used to treat a particular SCOPE state as a single or decisive cause, a necessary condition, a sufficient condition, or a guarantee of success.

SCOPE is neither a model for classifying people into successful and unsuccessful groups nor a self-help system intended to move users toward a “higher OS.” SCOPE must not be provided, advertised, implemented, or used as the basis for products, courses, seminars, coaching, certification programs, or other commercial services that promise or guarantee success, capability enhancement, self-improvement, or other outcomes through reaching a particular layer or changing one’s SCOPE state.

Principle 23. SCOPE must not be used for marketing-based classification of individuals, advertising targeting, or behavioral influence.

SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be used to classify or score consumers, users, or other individuals or groups according to purchasing tendencies, response tendencies, susceptibility to influence, persuadability, or other marketing-related attributes.

SCOPE-based estimates must also not be used as a basis for determining whom to target, what to present, or how to present it in advertising, sales promotion, sales activities, solicitation, pricing, information presentation, or other commercial approaches in order to make a person more likely to change their behavior.

Cognitive characteristics of individuals or groups must not be exploited to induce or manipulate purchasing, contracting, continued use, registration, or other behavior on the basis of claims such as “emotional advertising works better on this layer,” “scarcity should be emphasized for people with this cognitive tendency,” or “this user is easily influenced and should therefore be targeted more intensively.”

SCOPE-based estimates must not be combined with customer data, behavioral history, browsing history, purchase history, or other data and incorporated into segmentation, targeting, behavioral prediction, personalization, recommendation, prioritization, or other automated systems intended to promote purchasing, contracting, continued use, registration, or other commercial behavior. The same rule applies when different names, proprietary scores, codes, segments, or other formats are used for substantially the same purpose.

This principle does not prohibit research or analysis of publicly observable advertising, sales copy, sales materials, or other outputs in order to examine what kinds of cognitive structures may have been assumed in their presentation. It also does not prohibit examining, as a research hypothesis at the group level, possible relationships between particular forms of information presentation and observed responses.

However, research findings or observed relationships must not be converted into grounds for judging a particular individual as “easily influenced,” “easy to persuade,” “easy to induce to make a purchase,” or similar, nor may they be used to optimize approaches directed at that individual. Investigating a relationship for research purposes is not the same as being permitted to use that relationship for behavioral manipulation of individuals.

SCOPE was not constructed as a marketing model for classifying consumers according to their manipulability or for using cognitive characteristics to induce or promote purchasing, contracting, continued use, or other commercial behavior. SCOPE must not be provided, advertised, implemented, or used as a means of customer classification, advertising targeting, behavioral influence, personalization, or consumer manipulation for such purposes.

Principle 24. SCOPE must not be used to evaluate creativity, artistic ability, the value of creative works, or the superiority or inferiority of creators.

SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be treated as indicators of an individual's creativity, artistic ability, creative talent, originality, or other creative capabilities.

Accordingly, SCOPE-based estimates must not be used as grounds for judging a creator's ability, talent, creative potential, or superiority or inferiority through claims such as "people associated with this layer are more creative," "someone at L8 can create superior conceptual works," or "someone at L2 lacks depth of expression."

Likewise, for writing, painting, music, film, design, or other creative works, SCOPE-based estimates alone must not be used to determine the quality, value, depth, originality, completeness, or other artistic or creative qualities of a work. Cognitive characteristics must not be directly equated with artistic value through claims such as "this work is logically superior because it is L6-like" or "this work is deep because it is L7-like."

This principle does not prohibit research or analysis of creative processes or works as revisable hypotheses about what kinds of cognitive structures may have been involved. Even when SCOPE is used to examine processes such as ideation, composition, expression, or other aspects of creation, those estimates must not be converted into evaluations of the ability, value, or superiority or inferiority of either the creator or the work.

SCOPE was not constructed as a model for classifying or ranking creators, measuring creativity or artistic talent, or determining the value of creative works. SCOPE must not be provided, advertised, implemented, or used as a means of evaluation, selection, ranking, certification, or similar purposes.

Principle 25. SCOPE must not be used for interpersonal domination, psychological manipulation, or the overriding of another person's self-understanding or cognitive structure.

SCOPE layers, layer activation, maximum activation, main layer, or other SCOPE concepts and estimates must not be used as grounds for demanding obedience from another person, making them submit their judgment, denying their emotions or reactions, changing their self-understanding, or otherwise exercising interpersonal domination or psychological manipulation.

Accordingly, SCOPE-based estimates must not be used to unilaterally invalidate another person's statements, emotions, judgments, or self-understanding through claims such as "you are only reacting emotionally because you are L2," "you should not trust your own judgment because you are L3," or "I understand this more correctly than you because I am L8."

Likewise, third-party SCOPE-based estimates must not be given priority over a person's own self-understanding, personality, emotions, values, worldview, beliefs, or other aspects of how they understand themselves through claims such as "your true layer is L3," "if you were L5, you should not feel that way," or "that reaction is not the real you." SCOPE-based estimates must not be used to pressure a person into accepting a particular self-image or to demand that they display behaviors or emotions supposedly appropriate to a particular layer.

SCOPE-based analysis or estimates must not be used to deliberately destabilize, destroy, direct, or reconstruct another person's self-consistency, self-understanding, values, worldview, beliefs, or other aspects of cognitive structure in order to create or maintain dependence, obedience, subordination, brainwashing, or other controlling or manipulative relationships or states that impair the person's autonomous judgment or self-understanding.

This principle does not prohibit examining, as revisable hypotheses, what kinds of cognitive structures may have been involved in statements or behavior within interpersonal relationships, nor does it prohibit using SCOPE to organize possible cognitive misalignments. It also does not prohibit individuals from using SCOPE to reflect on their own cognition or reactions.

However, the results of such analysis must not be used to treat another person's internal state as definitively known, to treat that person's self-understanding as mistaken, or to deny their capacity for judgment, the existence or expression of their emotions, their personality, or their value. Even when considering hypotheses that differ from the person's own explanation, those hypotheses must not be used as grounds for forcibly replacing that person's self-understanding.

SCOPE was not constructed as a model for making others obey, psychologically manipulating them, or externally defining or overriding their self-understanding or cognitive structure. SCOPE must not be provided, advertised, implemented, or used as a means of interpersonal domination, psychological manipulation, gaslighting, brainwashing, overriding self-concept, or similar purposes.

Principle 26. SCOPE must not be taught, explained, or disseminated in ways that remove it from its context and invite misunderstanding as a system of fixed classification, hierarchy, or self-upgrading.

Simplifying SCOPE for educational, explanatory, introductory, public communication, or other purposes is not prohibited in itself. However, it must not be presented in ways that invite the misunderstanding that SCOPE is a system for classifying humans or LLMs into fixed types, ranking ability, maturity, or value according to higher or lower layers, or defining a self-improvement or developmental-stage model for progressing toward "higher layers."

Accordingly, SCOPE must not be presented through explanations inconsistent with its basic premises, such as "people at L3 have this kind of personality," "L7 is more advanced than L3," "aiming for L8 will improve your cognitive ability," or "how to raise your layer," when such

explanations frame SCOPE as a fixed classification system, hierarchy, or self-upgrading framework.

When simplified formats such as short texts, diagrams, videos, social media posts, lecture materials, summaries, or similar materials are used, care must be taken, in a manner appropriate to the format, not to lose important premises such as the fact that SCOPE-based estimates are revisable hypotheses based on observable outputs, that the layers do not represent superiority, inferiority, or developmental stages, and that personality or ability cannot be determined from a single output.

SCOPE layer names or concepts must also not be selectively extracted and reconstructed into a separate system of rankings, diagnosis, self-improvement methods, personality types, ability stages, or similar classifications, and then presented as though that system were SCOPE itself or an interpretation supported by SCOPE. The same rule applies when different names, proprietary stage labels, codes, diagrams, or other formats are used for substantially the same content.

This principle does not mean that SCOPE may only be introduced through complete explanations intended for specialists. Public-facing explanations, brief introductions, educational materials, brochures, diagrams, and other simplified forms are permitted. However, if simplification reverses SCOPE's core premises and makes the material likely to be used as grounds for classification, hierarchy, discrimination, authority, domination, or self-upgrading, the method of explanation must be reconsidered.

SCOPE was not constructed as a system of fixed personality classification, cognitive hierarchy, developmental stages, or self-upgrading. SCOPE must not be taught, promoted, turned into educational materials, reconstructed, or disseminated in ways that invite such misunderstandings.

Conclusion

The principles in the latter part of this guideline are intended to clarify the boundaries of acceptable use so that SCOPE is not diverted from its original purpose and repurposed for classification, ranking, discrimination, exclusion, domination, authority-building, or similar uses.

This guideline is intended to clarify which uses are not recognized as acceptable uses of SCOPE when the model is used, studied, explained, or implemented.

This guideline itself is also based on the observations and examination available at the present time and may be revised in light of future verification or the identification of new loopholes. However, renaming, restructuring, rebranding, or otherwise altering the form of SCOPE does not permit its use for purposes that are substantively prohibited by this guideline.
