

SCOPE : L2 – Emotional Configuration

senkaL8

Chapter 0. Introduction

The Sephirotic names used in this paper are not used in a religious or mystical sense. In SCOPE, they are borrowed as labels for identifying cognitive structures.

SCOPE (Sephirotic Cognitive Process Engine) is a coordinate system for estimating the cognitive structures of humans and AI. Here, "coordinate system" does not refer to a flowchart in which cognitive processing proceeds in a fixed order. Rather, it refers to a framework for organizing and estimating cognitive structures. Each layer does not indicate a hierarchy or a temporal sequence.

In SCOPE, the state in which the result of cognitive processing is output into reality and becomes observable is positioned as Malkuth. What can be observed is the output itself; it is not possible to directly know what kind of cognitive structure operated internally. Therefore, SCOPE estimates the underlying cognitive structure by using observable output as a clue.

This paper addresses L2, one of the cognitive structures within SCOPE. L2 is a cognitive coordinate that represents the emotional configuration toward an object. However, this coordinate alone does not determine judgment or behavior. The definition and characteristics of L2 are discussed in detail in Chapter 1.

Chapter 1 What L2 Is

L1 addressed verbalization, a function within cognitive processing. L2, by contrast, is not positioned as a function that executes cognitive processing, but as a cognitive coordinate representing the emotional configuration toward an object at a given moment. This distinction is an essential premise for understanding L2.

L2 is a cognitive coordinate that represents the emotional configuration toward an object.

L2 is not a cognitive coordinate that generates emotion. Nor is it a cognitive coordinate that determines judgment or behavior. Within SCOPE, observed facts are treated as clues, and L2 is positioned as a cognitive coordinate for organizing and inferring the emotional configuration toward an object at that point in time.

L2, as used here, does not refer to any specific biological organ or region of the brain. Within SCOPE, it is treated as one of the cognitive coordinates used to organize and infer cognitive structure.

This paper positions L2 as a cognitive coordinate representing the emotional configuration toward an object, and examines its characteristics in the chapters that follow.

Chapter 2 Basic Characteristics of L2

L2 is a cognitive coordinate that represents the emotional configuration toward an object. Within SCOPE, L2 is positioned as a cognitive coordinate for organizing and inferring the emotional configuration for each object.

Furthermore, L2 is not a cognitive coordinate that determines judgment or behavior on its own. The emotional configuration toward an object is positioned as one part of the overall cognitive structure, within its relationship to other layers. For this reason, L2 alone cannot account for the entirety of cognitive structure.

This paper positions L2 as a cognitive coordinate carrying these basic characteristics.

Chapter 3 L2 Changes

L2 is not a cognitive coordinate that represents a single, fixed emotional configuration. Even for the same object, the emotional configuration toward that object may change.

The magnitude and duration of this change are not fixed. It may be observed as temporary, or it may be observed as continuing over an extended period.

This change is not something L2 generates on its own. The cognitive processes underlying this change are addressed in Chapter 4.

Chapter 4 L2 Interacts with Other Layers

L2 is not a cognitive coordinate that changes on its own. The emotional configuration toward an object is organized and inferred through interaction with other layers.

The layers L2 interacts with are not limited to one. For example, interaction with multiple layers, such as L3, L4, and L5, is presupposed. However, how each of these layers is involved is not addressed in this paper.

Within SCOPE, L2 is treated as an independent cognitive coordinate, while also being positioned as a cognitive coordinate that presupposes interaction with other layers. For this reason, understanding L2 requires also considering its relationship to other layers.

The detailed roles of each layer and the mechanisms of their interaction are not addressed in this paper. These are addressed in papers dealing with each individual layer and with SCOPE as a whole.

Chapter 5 L2 and Its Relationship to Malkuth

L2 is a cognitive coordinate that is organized and inferred using information observed as Malkuth as a clue.

For example, observed results such as statements or behavior may serve as a clue for provisionally placing an emotional configuration toward an object. However, L2 is not necessarily determined uniquely from the information available at that point.

For this reason, within SCOPE, an emotional configuration toward an object is provisionally placed based on observed information, and is then organized and inferred while also taking consistency with other layers into account.

This provisional placement does not mean immediate commitment to a single interpretation. Depending on the situation, multiple interpretations may be retained and treated as such.

This paper positions L2, in this way, as a cognitive coordinate that is organized and inferred from Malkuth.

Chapter 6 Correspondence with LLMs

L2 has been positioned as a cognitive coordinate that represents, in humans, the emotional configuration toward an object. This does not mean that current LLMs possess the same emotions as humans.

However, in dialogue, positive or negative output tendencies toward an object, and changes in these tendencies, may be observed. As a functional correspondence for organizing such changes, a process corresponding to L2 may exist.

The object referred to here does not imply that a specific module exists as an internal structure. It refers to a unit — a party or piece of information — that serves, on an observational level, as the basis for response generation.

For example, even for responses to the same object, output tendencies may change depending on preceding context or dialogue history. Such changes cannot be equated with human emotion, but they can be mapped onto a coordinate for organizing and inferring cognitive structure.

The correspondence addressed in this paper assumes systems that generate responses while retaining internal state, such as dialogue history. Systems that respond through simple processing of a single input alone are outside the scope of this paper.

At present, this correspondence is a functional hypothesis, and does not assert psychological or neuroscientific identity.

This paper positions this functional correspondence, in this way, as a hypothesis regarding the correspondence between L2 and LLMs.

Conclusion

This paper has positioned L2 as a cognitive coordinate that represents the emotional configuration toward an object.

L2 was positioned as a cognitive coordinate that does not change on its own and does not determine judgment or behavior by itself, but is organized and inferred through interaction with multiple other layers. It was also shown that L2 is provisionally placed based on information observed as Malkuth, and that this does not mean immediate commitment to a single interpretation — multiple interpretations may be retained in some cases.

Furthermore, without equating humans and LLMs, this paper organized the correspondence with L2 from the standpoint of functional correspondence, as a hypothesis.

While this paper has focused on organizing L2, the cognitive processes through which the emotional configuration toward an object is formed and changes are not addressed within the scope of this paper.

The next paper will address L3 as the cognitive layer responsible for self-consistency, examining it in relation to L2.
