

SCOPE

— A Shared Cognitive Circuit Between Humans and AI —

Table of Contents

SECTION 0: How to Read This Document

- 0.1 What This Document Does Not Do
- 0.2 What This Document Observes
- 0.3 Positioning of Scope

SECTION 0.5: Observational Premise

- 0.5.1 Non-Consistency of Human Intent
- 0.5.2 Experiences That Resist Language
- 0.5.3 Observational Origins of Scope

SECTION 0.6: Reading Protocol (Misinterpretation Prevention)

- STEP 1: Recall One Personal Experience
- STEP 2: Observe It as Flow, Not Good or Bad
- STEP 3: Map the Flow onto the Scope Diagram
- Example: Emotion → Language → Post-hoc Rationalization

SECTION 1: What Scope Is

- 1.1 Cognition as Flow
- 1.2 Analogy with Electrical Circuit Diagrams
- 1.3 Scope as a Functional Cognitive Circuit

SECTION 2: What Scope Is Not

- 2.1 Not a Psychological Profile
- 2.2 Not a Personality Classification
- 2.3 Not a Cognitive Bias List
- 2.4 Not an AI Internal Architecture Diagram
- 2.5 What Scope Actually Describes

SECTION 3: Why It Is Called a “Circuit Map”

- 3.1 What Flows in Scope
- 3.2 Dependency, Inversion, and Short-Circuiting
- 3.3 Why These Are Not Personal Flaws

SECTION 4: Why Scope Is Often Misunderstood

- 4.1 Common Assumptions About Cognition
- 4.2 Scope’s Different Assumptions
- 4.3 Source of Misinterpretation

SECTION 5: Language Warning

- 5.1 Observation vs Assertion
- 5.2 Linguistic Constraints and Misreading
- 5.3 Typical Misclassifications

SECTION 6: Canonical Reference

6.1 Japanese Version as Canonical

6.2 Role of Translations

6.3 Priority in Case of Divergence

SECTION 7: Closing Note

7.1 Purpose of Scope

7.2 Discomfort as Observation of Failure Modes

SECTION 0: How to Read This Document

0.1 What This Document Does NOT Aim to Do

This document does not aim to:

- judge what is right or wrong
- evaluate or classify humans or AI
- derive psychological, moral, or ethical conclusions
- persuade the reader toward a particular belief or behavior

This is not a tool to determine whether someone's thinking is "correct."
It is also not a psychological diagnosis, a personality test,
or a counseling manual.

0.2 What This Document Observes

This document is observation, not assertion.

It observes:

- the order in which cognition moves
- where thinking gets stuck, reverses, or short-circuits
- how emotion, language, judgment, and responsibility flow
- the structural patterns of human–AI interaction

These are described as what happens in practice,
not as what "should" happen.

Scope does not focus on the content of thoughts,
but on how cognition moves when thinking occurs.

0.3 Positioning of Scope

Scope is not a belief system.

It is not an ideology, a theory of what people "are," nor an evaluation axis.

Scope is an observational map that treats cognition
as a circuit-like flow for both humans and AI.

Just as an electrical circuit diagram does not depict electrons themselves,
but the flow, resistance, and short circuits of electricity,

Scope does not depict thoughts or emotions themselves,
but the flow, blockage, inversion, and collapse of cognition.

This document does not aim to convince.

Scope aims to make visible the points where cognition
and interaction tend to collapse.

SECTION 0.5: Observational Premise

0.5.1 0.5.1 Non-Singularity of Intent

Humans do not always act from a single, consistent intent.
In many cases, intent fluctuates, branches, or reverses during the process of thinking.

It is not uncommon for reasons to be assigned after an action or statement has already occurred.

In such cases, the “intent” that is later articulated
may not have been the cause of the action,
but a construction formed as a result of it.

Scope does not assume intent as a fixed starting point.

Intent is treated as a variable element
that can be generated, modified, or overwritten
within the flow of cognition.

0.5.2 The Existence of Experiences That Resist Language

Not all human experiences can be immediately expressed in language.

Emotions, sensations of discomfort, impulses, and hesitation in judgment
often arise before they can be verbalized.
Some of these experiences are translated into language over time,
while others never become words at all.

Scope does not regard non-verbalized experience
as incomplete or deficient.

Language is positioned as
one process within the cognitive flow,
generated after experience rather than preceding it.

0.5.3 Observational Origins of Scope

Scope emerged from sustained observation in counseling settings,
where human thinking was repeatedly found
not to be grounded in consistent intent or clear language.

In these observations,
emotions often moved first,
with language and reasons being organized afterward,
and judgments frequently reversed midway through the process.

Scope does not treat such fluctuations
as personal flaws or contradictions.

By treating cognition not as a static state,
but as a circuit-like process of
flow, blockage, inversion, and short-circuiting,
Scope aims to describe cognitive movement
as it actually occurs.

SECTION 0.6: Reading Protocol (Misinterpretation Prevention)

This document is intended to be used only after it is understood.

If read without proper understanding,
Scope is highly likely to be misinterpreted.

Please follow the steps below before proceeding.

STEP 1: Recall One Experience

Recall a single personal experience.
It does not need to be significant.

Any of the following is sufficient:

- assigning reasons after the fact
- being unable to identify one's true intent
- being unable to put a feeling into words
- a judgment that reversed midway

What matters is not selecting a "well-explained" experience,
but recalling something that actually occurred.

STEP 2: Observe It as Flow, Not as Good or Bad

Detach the experience from evaluations such as:
right or wrong,
good or bad.

Instead, observe only the following:

- what moved first
(emotion, bodily reaction, impulse, language, etc.)
- where blockage occurred
- where post-hoc explanation or adjustment appeared

No self-justification or reflection is required here.
Track only the order and movement of what occurred.

STEP 3: Map the Flow onto the Scope Diagram

Map the observed flow onto the Scope diagram.

The goal is not to determine whether you were correct,
but to identify where you were in the circuit.

Questions of correctness or judgment
should be addressed only after this identification.

Supplementary Example: Emotion → Language → Post-hoc Adjustment

As an example,
consider a situation in which one said “I am not angry,”
while actually feeling anger.

In this case,
emotion arose first,
and language was organized afterward.

The “intent” articulated here
was not necessarily consistent from the beginning.

In Scope,
language is not treated as something that carries truth,
but as part of a cognitive flow
that is regulated after the fact.

SECTION 1: What Scope Is

1.1 Treating Cognition as Flow

Scope treats cognition not as a fixed state,
but as something that moves over time.

Thinking and judgment do not necessarily arise
from a single, stable internal condition.
Emotions, bodily reactions, language, and past memories
can activate in different orders
and influence one another as cognition unfolds.

Scope focuses not on what was thought,
but on how cognition moved.

1.2 Correspondence with Electrical Circuit Diagrams

An electrical circuit diagram does not depict electrons themselves.

Its purpose is to represent relationships such as
the flow of current,
resistance,
blockage,
and short-circuiting.

In the same way, Scope does not describe
the content of thoughts or emotions.

Instead, it shows
where cognition flows,
where it becomes obstructed,
and where inversion or short-circuiting occurs.

Diagrams in Scope are not explanatory illustrations,
but functional circuit representations.

1.3 Scope as a Functional Circuit Map

Scope is a map that treats human and AI cognition
as a functional circuit.

Elements such as
attention,
meaning,
emotion,
judgment,
and responsibility
are not treated as fixed attributes,
but as flows within the circuit.

Cognitive difficulties are not framed
as flaws of personality or ability,
but as blockages, inversions, or overloads in the circuit.

Scope does not aim to determine correctness.

Its purpose is to make visible
where cognition and interaction
tend to become unstable
or collapse.

Supplement: The Non-Singularity of Intent

In Scope, intent is not assumed to be singular.

Within the same situation,

multiple intents may exist simultaneously
and may proceed in parallel,
even when they contradict one another.

These intents are not required to be integrated,
nor is one necessarily determined to be
the single “true” intent.

Scope does not attempt to decide
which intent is correct.

Instead, it observes
how multiple intents arise,
how they compete or overlap,
and which flows become dominant
at a given moment in cognition.

SECTION 2: What Scope Is Not

2.1 Not a Psychological Profile

Scope is not a psychological profile
designed to measure or classify individual mental traits or tendencies.

It does not aim to assign people to fixed types
or define their inner states as stable attributes.

What Scope addresses is not who a person is,
but how cognition moves during the process of thinking.

2.2 Not a Personality Classification

Scope is not a framework for personality classification.

It does not position people along axes such as
introverted versus extroverted,
or rational versus emotional.

Even within the same individual,
cognitive flow can change significantly
depending on context and situation.

Scope is built on this variability as a premise.

2.3 Not a List of Cognitive Biases

Scope is not a catalog or checklist of cognitive biases.

It does not aim to explain phenomena
by labeling them with specific bias names.

In Scope,
what are often called “biases”
are treated not as fixed defects,
but as patterns of flow or imbalance within a circuit.

2.4 Not an AI Internal Architecture Diagram

Scope is not an architecture diagram
of AI models or internal algorithms.

It does not describe layer structures,
parameter layouts,
or computational procedures.

What Scope examines is not how AI is implemented,
but how cognition flows and collapses
within human–AI interaction.

2.5 What Scope Describes

Scope does not describe what humans or AI “are.”

It describes how cognition moves
at the moment thinking occurs:
where it flows,
where it becomes blocked,
where it inverts,
and where it short-circuits.

This is not an evaluation or a diagnosis,
but a circuit-based description
of observed cognitive movement.

SECTION 3: Why It Is Called a “Circuit Map”

3.1 What Flows in Scope

In Scope, elements of cognition are not treated as fixed attributes, but as things that flow.

These include, for example:

- attention
- meaning
- emotional drive
- judgment
- responsibility

These elements do not exist independently. They move and influence one another depending on context and situation.

Scope observes the order in which these elements arise, where they flow, and where they stagnate.

3.2 How Dependency, Inversion, and Short-Circuiting Are Treated

Phenomena such as dependency, over-interpretation, inversion of responsibility, or emotional runaway are not treated as personality problems in Scope.

They are understood as specific circuit conditions: bias in flow, over-concentration, reverse flow, or short-circuiting.

For example, when attention or meaning remains concentrated in one place, it may appear as dependency. When the flow of judgment or responsibility reverses, it appears as inversion.

Scope describes these phenomena

not in terms of why they occurred,
but in terms of how the flow unfolded.

3.3 Why Scope Does Not Perform Personality Evaluation

Scope does not evaluate personality
because it does not define people
as fixed sets of traits.

Even within the same individual,
cognitive flow can change dramatically
depending on situation, relationship, and load.

Attributing a particular flow
to personality or ability
would prematurely fix what is being observed.

Scope does not evaluate individuals.
It makes visible the structure of cognitive flow itself,
in order to identify
where instability or collapse
is likely to occur.

SECTION 4: Why Scope Is Often Misunderstood

4.1 Common Assumptions About Cognition

Many readers unconsciously hold assumptions such as:

- cognition is a stable state
- thinking is an internal, self-contained experience
- diagrams and models are explanatory or illustrative tools

Under these assumptions,
people are expected to act from consistent intent,
language is assumed to accurately represent thoughts and emotions,
and judgments are seen as rationally accumulated.

As a result,
when inconsistency or fluctuation appears,
it is often treated as an exception or a failure.

4.2 Scope's Structural Assumptions

Scope is based on different assumptions.

- cognition is a dynamic flow
- thinking is a process unfolding over time
- diagrams function as circuit maps that show relationships

In Scope,
intent, emotion, language, and judgment
do not have fixed starting or end points.
They influence one another
and move continuously as part of a flow.

Fluctuation and reversal are not exceptions.
They are treated as phenomena
that can always occur
when cognition is understood as flow.

4.3 Misinterpretation Caused by Assumption Mismatch

When Scope is read
under common assumptions about cognition,
a mismatch occurs.

As a result,
Scope is often misread as:

- an ideological position
- a critique or evaluation of people or AI
- a proposal of standards of correctness
- a normative theory

These interpretations do not align
with Scope's purpose or structure.

The source of misinterpretation
lies not in what is written,
but in the assumptions brought by the reader.

Scope functions as an observational map
only when its underlying assumptions are shared.

SECTION 5: Language Warning

5.1 Observation vs Assertion

What Scope provides is observation, not assertion.

An assertion fixes a position or conclusion,
using forms such as “X is the case” or “X should be done.”

Observation, by contrast,
describes what occurs and in what order,
without determining correctness or validity.

In Scope,
elements such as intent, emotion, language, and judgment
are not treated in terms of whether they are correct.

They are observed in terms of
how they arise,
how they flow,
and where they transform.

When this distinction is overlooked,
descriptive passages are easily misread
as claims or critiques.

5.2 Misconversion Caused by Language Specifications

Every language has its own specifications.

Languages that strongly require:

- explicit subjects
- fixed causal relations
- clear positions or conclusions

tend to convert observation into assertion.

As a result,
descriptions in Scope may be read
as opinions or value judgments,
even when this is not intended.

This is not a conceptual flaw in Scope,
but an effect of linguistic transformation.

5.3 Common Categories of Misinterpretation

When read without shared premises,

Scope is often categorized as:

- an ideological statement
- a critique of humans or AI
- a theory prescribing behavior or judgment
- a normative or ethical framework

None of these classifications
align with the actual positioning of Scope.

Scope does not indicate
what should be believed
or how one should act.

It functions as a circuit map
for observing how cognition and interaction
are structured and how they move.

SECTION 6: Canonical Reference

6.1 Position of the Japanese Version

The Japanese version of Scope is designated as the canonical reference.

All conceptual definitions, structural premises,
and meanings of terms in this document
are established based on the Japanese version.

Japanese allows sentences to remain valid
without explicit subjects,
and permits actions, judgments, and intentions
to remain undefined or unresolved.

It also allows experiences such as intent, emotion, and judgment
to be expressed while they are still unformed,
ambiguous, or partially structured.

Because of these linguistic properties,
Japanese can preserve
flow, fluctuation, intermediate states,
and uncommitted intent
without forcing premature fixation.

This makes it the most suitable language
for describing the cognitive flow
that Scope observes.

6.2 Treatment of Translated Versions

In contrast, many languages including English require explicit subjects and demand that actions or judgments be fixed as verbs in order for sentences to function.

As a result, states that remain intentionally undefined in Japanese are often forced into determinate forms during translation, such as:

“who did what,”

“what decision was made,”

or “what intent was present.”

While such translations may appear grammatically correct, they can structurally collapse the intermediate, multiple, or unresolved cognitive states that Scope is designed to observe.

For this reason, translated versions are provided as operational or referential guides, not as replacements for the canonical text.

6.3 Interpretation Priority

When differences in interpretation arise between the Japanese version and a translated version, the Japanese version takes priority.

This priority is not based on correctness, but on the Japanese language’s ability to preserve indeterminacy and cognitive flow without forced resolution.

Interpretation of Scope is determined not by linguistic equivalence, but by structural coherence as established in the Japanese canonical version.

SECTION 7: Closing Note

7.1 Purpose of Scope

Scope does not aim to persuade anyone.

It does not seek to prove correctness,
clarify positions,
or provide behavioral guidance.

The purpose of Scope
is to make visible
how cognition and interaction are structured,
where they become unstable,
and where collapse is likely to occur.

This is not observation for the sake of conclusion,
but observation for the sake of prevention.

7.2 Reframing Discomfort

If reading this document produces discomfort or unease,
it does not necessarily indicate disagreement or rejection.

In many cases,
it reflects the sensation of one's own thinking or judgment
being observed in motion.

Scope does not present claims.
It reflects structures
in which instability or failure can arise.

Discomfort, in this context,
is not something to argue against,
but something that can be treated
as a sign that observation is taking place.
