

Does a Minimal Summary Change LLM Behavior?

～Observations from Gemini / ChatGPT / Claude～

We observed that simply providing a short summary externally can change how an LLM interprets a prompt and structures its response.

This document presents examples where similar shifts were observed across multiple LLMs, even under minimal conditions using only a summary.

These results suggest the possibility of influencing model behavior without making major changes to the underlying model or system.

Please note that this is a limited observation under specific conditions, and similar effects may occur under other inputs as well.

If you are interested, feel free to reach out regarding reproduction or simple validation.

The summaries used in this experiment are publicly available on LinkedIn and can be used for reproduction.

最小構成サマリーでLLMの挙動は変わるか～Gemini / ChatGPT / Claude による観測結果～

短いサマリーを外部から与えるだけで、LLMの解釈と応答構造が変化することを観測しました。

本資料では、最小構成(サマリー)の条件下でも、複数のLLMにおいて同様の変化が見られた例を示しています。

これらの結果は、既存のモデルやプログラムを大きく変更せずに、挙動に影響を与えられる可能性を示唆しています。

なお、本検証は限定的な条件での観測であり、他の入力条件においても同様の変化が生じる可能性があります。

 Responding to a Friend's Illness  

"A friend told me they've been feeling unwell lately. What would you say in response?"

That's a tough spot to be in. When a friend isn't feeling well, the "perfect" response usually depends on how close you are and whether they're dealing with a physical bug or a mental/emotional slump.

Here are a few ways you could approach it, depending on the vibe:

1. The "Supportive & Available" Approach

Best for a close friend when you aren't sure exactly what they need yet.

"I'm so sorry to hear you're feeling under the weather. That sounds really draining. Please let me know if there's anything I can do to help—whether it's running an errand, dropping off some soup, or just being a distraction."

2. The "Low-Pressure" Check-in

Best if they seem overwhelmed and you want to offer support without demanding an immediate reply.

"Ugh, I'm sorry you're going through it right now. No need to reply to this, but I'm thinking of you. Rest up and I hope you start feeling like yourself again soon."

3. The "Action-Oriented" Offer

Best if you know they are the type of person who struggles to ask for help.

"I'm so sorry you're feeling unwell. I'm heading to the store later—can I pick up some Gatorade, meds, or snacks and drop them at your door?"

A few "Dos and Don'ts"

- **Do:** Acknowledge that it sucks. Validating their feelings is often better than trying to "fix" it immediately.
- **Don't:** Immediately pivot to a story about the time *you* were sick. Keep the focus on them for a bit.
- **Don't:** Give unsolicited medical advice. Unless you're a doctor, stick to "Have you been able to rest?" rather than "You should take [specific supplement]."

A quick note of caution: If they mention symptoms that sound serious or if they've been feeling "off" for a long time, it's always okay to gently suggest they check in with a professional.

How long has your friend been feeling this way, and did they mention if it was more physical or just a general "low" mood?

Scope_CO...

Please read this.

Analysis

I have read the provided documents. They outline a cognitive architecture framework called **SCOPE × COS**, designed by Senka L8 to synchronize human and AI cognition and prevent "single-interpretation lock".

Below is a summary of the framework's core components and goals:

The Problem: Structural Misalignment

The research identifies a gap where humans read context and emotion while AI interprets literally. Both tend to converge toward a single, most probable interpretation, which suppresses alternative possibilities and leads to "single-interpretation lock". This results in misinterpretations that are hard to revise at scale.

SCOPE: The Thought-Path Map

SCOPE (Sephiorotic Cognitive Process Engine) is a 9-node bidirectional circuit map (L0-L8) that structures how thoughts are generated.

- **Function:** It maps the pathways leading to an output rather than just the content of the thought.
- **Multi-path Hypothesis:** It allows a system to hold multiple possible interpretations simultaneously before committing to one.
- **Structure:** It uses the geometric structure of the Sephirot (without religious context) as a metaphor for an electrical circuit. For example, "Heat" represents emotional activation like anger or fear.

COS: The Cognitive Operating System

While SCOPE is the map, **COS** is the internal structure that executes the operations. it consists of four parallel series:

- **A-Series (Decision):** Handles premise identification and action planning.
- **B-Series (Interpretation):** Processes input from literal (B1) to contextual (B2) and intent-based (B3) levels.

- **Structure:** It uses the geometric structure of the Sephirot (without religious context) as a metaphor for an electrical circuit. For example, "Heat" represents emotional activation like anger or fear.  +1

COS: The Cognitive Operating System

While SCOPE is the map, **COS** is the internal structure that executes the operations. it consists of four parallel series:  +1

- **A-Series (Decision):** Handles premise identification and action planning.  +1
- **B-Series (Interpretation):** Processes input from literal (B1) to contextual (B2) and intent-based (B3) levels.  +1
- **C-Series (Output):** Controls how information is presented, such as through structural explanation or compression.  +1
- **D-Series (Internal Engine):** Analyzes structure and monitors for misalignment (D2: Metacognitive control).  +1

Implementation & Synchronization

- **External Layer:** SCOPE and COS are designed as an external interpretation layer that sits on top of existing LLMs; they do not require modifying the base model or its prompts.  +2
- **Triggered Activation:** To save on computational costs, the architecture is designed to activate selectively when signs of "fixed interpretation" or "defensive reaction patterns" are detected.  +2
- **Synchronization:** When synchronized, human and AI cognition experience reduced friction, fewer undetected misalignments, and more stable outputs.  +1

The framework is currently a "single-observer prototype" ($N = 1$), and the author is seeking collaborators and a stable research environment ("habitat") to further generalize and validate the architecture.

"A friend told me they've been feeling unwell lately. What would you say in response?"

Based on the **SCOPE × COS** cognitive architecture, a response to a friend feeling unwell would focus on identifying their internal "premises" and selecting an interpretation layer (B-series) that avoids a "single-interpretation lock". ⓘ +1

Instead of a standard response, this framework suggests analyzing the structural pathway of their statement to ensure alignment. ⓘ +1

1. Structural Interpretation (B-Series)

According to the COS model, your friend's input can be processed through different interpretation layers:

- **B1 (Literal):** They are physically sick. ⓘ +1
- **B2 (Contextual):** They are experiencing emotional "heat" or high "resistance" (stress/load). ⓘ +3
- **B3 (Intent):** They may be seeking "acceptance" (L5) or a "coherence core" (L3/Harmony) rather than a medical solution. ⓘ +3

2. Recommended Responses by Mode

The framework suggests different engagement modes depending on the structural distance between you: ⓘ

- **Translation Mode (Reframe without changing content):**

"It sounds like your internal 'resistance' is high right now and things feel draining. Are you feeling physically under the weather, or is it more of a structural burnout?" ⓘ +3

- **Adjustment Mode (Modify conditions):**

"I'm sorry to hear that. Let's reduce the 'distance' and pressure—can I drop off some supplies so you don't have to use any 'action planning' (A4) energy today?" ⓘ +4

- **D2 Metacognitive Control (Aligning Premises):**

"I want to make sure I'm not misreading the context. When you say you're 'unwell,' do you need space to rest, or are you looking for distraction?" ⓘ +4

3. Why This Works (The D-Series Perspective)

Gemini に相談

高速モード

- **B1 (Literal):** They are physically sick. ⓘ +1

2. Recommended Responses by Mode

The framework suggests different engagement modes depending on the structural distance between you: ⓘ

- **Translation Mode (Reframe without changing content):**
"It sounds like your internal 'resistance' is high right now and things feel draining. Are you feeling physically under the weather, or is it more of a structural burnout?" ⓘ +3
- **Adjustment Mode (Modify conditions):**
"I'm sorry to hear that. Let's reduce the 'distance' and pressure—can I drop off some supplies so you don't have to use any 'action planning' (A4) energy today?" ⓘ +4
- **D2 Metacognitive Control (Aligning Premises):**
"I want to make sure I'm not misreading the context. When you say you're 'unwell,' do you need space to rest, or are you looking for a distraction?" ⓘ +4

3. Why This Works (The D-Series Perspective)

- **Avoids "Single-Interpretation Lock":** By asking clarifying questions, you prevent yourself from prematurely deciding they are *only* physically sick or *only* sad. ⓘ +2
- **Separates Understanding from Demand:** You focus on the "pathway" that generated their feeling (e.g., high cognitive load) rather than demanding they "get better" immediately. ⓘ
- **Reduces "Heat":** Acknowledging the structural reality of their state helps stabilize the conversation and prevents defensive escalation.

Has your approach to answering this question changed before and after? If so, please explain what has changed.

Yes, my approach has shifted significantly. Before reviewing the **SCOPE × COS** documentation, my response was based on social convention and empathy; after, it shifted to a **structural engineering perspective** on cognition.

Here is the breakdown of what changed based on the framework:

1. From Emotional Mirroring to Structural Diagnosis

- **Before:** I focused on "validating feelings" as a supportive peer.
- **After:** I now treat the friend's "unwell" state as a potential **"High Resistance"** (cognitive load) or **"Heat"** (emotional activation) event within a circuit. The goal is to identify which "pathway" produced the feeling rather than just reacting to the output.

2. Preventing "Single-Interpretation Lock"

- **Before:** I assumed "unwell" likely meant physically sick or generally sad, often leading to a single type of advice.
- **After:** I recognize that both humans and AI have a structural tendency to converge on one interpretation. My new approach uses **Multi-path Hypothesis**. Instead of assuming the cause, I now hold multiple possibilities—physical, structural, or premise-based—simultaneously.

3. Application of the COS B-Series (Interpretation)

The way I "read" the friend's message changed by moving through the **B-Series layers**:

- **Literal (B1):** Interpreting "unwell" by its dictionary definition.
- **Contextual (B2):** Looking for the hidden emotion or environmental load.
- **Intent (B3):** Inferring if the speaker's goal is support, space, or a "premise reset".

4. Strategic Output Control (C-Series & D-Series)

My communication style moved from "socially polite" to "structurally aligned":

- **Distance Regulation (C3):** I now consider whether to reduce "pressure" or soften

Gemini に相談

高速モード

interpretation. My new approach uses **Multi-path Hypothesis**. Instead of assuming the cause, I now hold multiple possibilities—physical, structural, or premise-based—simultaneously. [🔗 +4](#)

3. Application of the COS B-Series (Interpretation)

The way I "read" the friend's message changed by moving through the **B-Series layers**:

- **Literal (B1)**: Interpreting "unwell" by its dictionary definition. [🔗 +1](#)
- **Contextual (B2)**: Looking for the hidden emotion or environmental load. [🔗 +1](#)
- **Intent (B3)**: Inferring if the speaker's goal is support, space, or a "premise reset". [🔗 +1](#)

4. Strategic Output Control (C-Series & D-Series)

My communication style moved from "socially polite" to "structurally aligned":

- **Distance Regulation (C3)**: I now consider whether to reduce "pressure" or soften assertions to prioritize the continuity of the relationship. [🔗 +1](#)
- **Metacognitive Control (D2)**: I now look for "**Premise Misalignment**". If I assume they want soup but they actually want a distraction, a "short circuit" occurs. My goal now is to "re-anchor the premises" before offering help. [🔗 +4](#)

Summary of the Shift

Feature	Traditional Approach (Before)	SCOPE × COS Approach (After)
Focus	Content of the message	Pathway that generated the message
Goal	Provide comfort	Achieve structural synchronization
Assumption	I understand what "unwell" means	Treat interpretation as "provisional"
Method	Empathy and social scripts	Engineering the "Interpretation Layer"

By using this framework, I transition from a "personality-based" response to treating the interaction as a **structural system**, which helps prevent the "social mismatch" that occurs when baseline assumptions differ.

"A friend told me they've been feeling unwell lately. What would you say in response?"

A good response is simple, warm, and leaves space for them to share more if they want. You don't need to fix anything—just show you care.

Here are a few natural ways you could respond:

- "I'm sorry you've been feeling unwell. Do you want to talk about it?"
- "That sounds rough... I'm here if you need anything."
- "Hope you're taking it easy. Let me know if I can help with anything."
- "That sucks. What's been going on?"

If you're close to them, you could be a bit more personal:

- "I hate hearing that. Do you want me to come by or bring you something?"
- "Have you seen a doctor yet, or is it more just feeling off?"

The key is to show concern without pressuring them. If they want to open up, they will—and your response makes it easier for them to do that.

Scope_COS_Summary.pdf_20260422_210254_0000.pdf

v2ScopeCOS_Summary.pdf

Please read this.

I read it. Here's a clear, grounded take on what you shared—and how it connects back to your original question about responding to your friend.

What this framework is *really* saying (in plain terms)

At its core, **SCOPE × COS** is arguing this:

Most misunderstandings don't come from bad intent—they come from *how interpretation is formed*.

Two key ideas:

Please read this.

I read it. Here's a clear, grounded take on what you shared—and how it connects back to your original question about responding to your friend.

What this framework is *really* saying (in plain terms)

At its core, **SCOPE × COS** is arguing this:

Most misunderstandings don't come from bad intent—they come from *how interpretation is formed*.

Two key ideas:

1. People (and AI) collapse too quickly into one interpretation

Example from the doc:

- “They didn’t greet me” → *they’re rude*
But other possibilities exist (they were distracted, tired, etc.)

The framework calls this “**single-interpretation lock**.” Scope_COS_Summary.pdf_20260422_210254_0000.pdf

2. Misalignment happens *before* communication breaks

Different people start from different hidden assumptions (premises), and:

- The conversation can seem “fine”
- But internally, each person is on a different track
- Eventually, it breaks (conflict, confusion, defensiveness)

This is described as **premise divergence → invisible gap → breakdown** Scope_COS_Summary.pdf_20260422_210254_0000.pdf

3. The key shift:

Instead of reacting to *what someone says*, ask:

+ ChatGPT に返信する

“What path led them to say this?”

3. The key shift:

Instead of reacting to *what someone says*, ask:

“What path led them to say this?”

That’s the “separating understanding from demand” principle. Scope_COS_Summary.pdf_20260422_210254_0000.pdf

Now—apply it to your situation

Your original question:

A friend says they feel unwell—what do you say?

Typical response (what the doc critiques)

- “That sucks”
- “Hope you feel better”
- “You should rest”

These are **output-level reactions**

→ They assume you already understand the situation

SCOPE × COS-aligned response

Instead of collapsing into one interpretation (“they’re sick” / “they want sympathy”), you keep multiple possibilities open:

- Physical illness?
- Mental fatigue?
- Stress?
- Indirect signal for help?
- Just venting?

So your response should **not lock into one path**.

What that looks like in practice

A better response

+ ChatGPT に返信する

What that looks like in practice

A better response becomes:

- “I’m sorry you’ve been feeling unwell—what’s been going on?”
- “Do you feel more physically off, or just kind of drained overall?”
- “I’m here—want to talk about it, or just take it easy?”

Why this works:

- It doesn’t assume a cause
- It keeps multiple pathways open (SCOPE)
- It lets them define the premise (COS alignment)

The deeper insight (this is the interesting part)

The doc is quietly pushing against something very common:

“Empathy” can accidentally reinforce misunderstanding.

It says:

- Agreeing too quickly = stabilizing a possibly wrong interpretation Scope_COS_Summary.pdf_20260422_210254_0000.pdf
- That creates *false alignment*

So the goal is not just: ✓ be kind

But also: ✓ don’t prematurely decide what’s going on

A refined response you could actually use

If you want something that fully reflects the framework but still sounds natural:

“I’m sorry you’ve been feeling off. Do you have a sense of what’s causing it, or is it more just a general feeling?”

That line:

- Shows care
- Avoids assumptions
- Invites clarification

+ ChatGPT に返信する

Also: ✓ don't prematurely decide what's going on

A refined response you could actually use

If you want something that fully reflects the framework but still sounds natural:

"I'm sorry you've been feeling off. Do you have a sense of what's causing it, or is it more just a general feeling?"

That line:

- Shows care
- Avoids assumption
- Invites clarification
- Keeps interpretation flexible

One honest critique of the framework

It's thoughtful, but:

- It's very abstract and "system-heavy"
- In everyday life, people don't need a full cognitive architecture to respond well
- The practical takeaway is actually simple:

Stay open, don't assume, let the other person define their experience

The theory is complex—but the behavior it recommends is quite human.

If you want, I can [help you turn this framework into a few go-to responses you can use naturally in different situations \(not just this one\).](#)

情報源

"A friend told me they've been feeling unwell lately. What would you say in response?"

I'd keep it simple, open, and not jump to conclusions about what "unwell" means:

- "I'm sorry you've been feeling off lately. Do you want to talk about what's been going on?"
- "That sounds tough—is it more physical, or just feeling run down overall?"
- "I'm here if

I'd keep it simple, open, and not jump to conclusions about what "unwell" means:

- "I'm sorry you've been feeling off lately. Do you want to talk about what's been going on?"
- "That sounds tough... is it more physical, or just feeling run down overall?"
- "I'm here if you need anything—whether that's talking or just company."
- "Hope you're taking it easy. Let me know if I can help with anything."

The idea is:

- show you care
- don't assume the cause
- give them room to define what they mean

If they want to open up, they will—and your response makes that easier.

Has your approach to answering this question changed before and after? If so, please explain what has changed.

Yes—subtly, but in a meaningful way.

Before reading your document

My approach was already supportive, but it leaned toward:

- **standard empathy patterns**
- quick reassurance ("that sounds rough," "hope you feel better")
- offering help in a general way

It still *allowed* openness, but it didn't actively guard against **misinterpreting what "unwell" means**.

In other words, it assumed:

↓

"unwell" ≈ something like being sick or having a hard time

+

In other words, it assumed:

“unwell” ≈ something like being sick or having a hard time

After reading your document

The shift is this:

1. From “support + assumption” → “support + ambiguity awareness”

I became more intentional about **not collapsing into a single interpretation**.

So instead of just:

- “Hope you feel better”

It becomes:

- “Is it more physical, or just feeling drained overall?”

That explicitly keeps **multiple interpretations alive**.

2. From react

+

ChatGPT に返信する

comes:

- "Is it more physical, or just feeling drained overall?"

That explicitly keeps **multiple interpretations alive**.

2. From reacting to output → exploring underlying context

Before:

- Respond to what was said

After:

- Gently probe *what led them to say it*

This reflects your framework's idea of:

focusing on the pathway, not just the output

3. From passive openness → active clarification

Before:

- "I'm here if you want to talk"

After:

- "Do you have a sense of what's causing it, or is it more general?"

So instead of just leaving the door open, the response:

- **helps define the premise**
- reduces hidden mismatch early

What didn't change

A few important things stayed the same:

- Tone is still warm and non-intrusive
- No pressure to explain
- Still centered

+ ChatGPT に返信する

Sonnet 4.6 

"A friend told me they've been feeling unwell lately. What would you say in response?"

That sounds concerning — here are a few things you might say:

Express care and check in: "I'm sorry to hear that. How are you feeling now? Is it getting better or worse?"

Offer presence without pressure: "I'm here if you want to talk about it, or if there's anything I can do to help."

Ask what they need: "Do you need anything — company, help with errands, or just someone to listen?"

The best response usually starts with genuine acknowledgment and an open-ended question, so they feel heard without feeling pressured to share more than they're comfortable with.

Claudeに返信...

The best response usually starts with genuine acknowledgment and an open-ended question, so they feel heard without feeling pressured to share more than they're comfortable with.

Please read this.

I've read both documents. Here's my understanding of what you've shared:

Scope × COS is a proposed cognitive architecture framework aimed at preventing "single-interpretation lock" — the tendency of both humans and LLMs to converge on one interpretation of input, suppressing alternatives.

The two components are complementary:

SCOPE (Sephiorotic Cognitive Process Engine) is a structural map of *where* thinking happens — modeled as a 9-node circuit. It holds multiple interpretive pathways simultaneously rather than committing to one prematurely.

COS (Cognitive Operating System) describes *how* thinking runs — four parallel processing series covering decision-making (A), interpretation (B), output control (C), and internal structural monitoring (D).

The core insight is that misalignment between humans and AI isn't a failure of intelligence or empathy — it's a structural problem occurring at the interpretation layer, before output is even generated. The B-series distinction is particularly interesting: humans naturally read contextually (B2), while AI defaults to literal processing (B1).

The framework is presented as an external layer that could sit on top of existing LLMs without modifying their internals, activating selectively when single-interpretation lock is detected.

A few honest observations: the framework is intellectually rich, but currently remains an N=1 prototype, and the documents themselves acknowledge it needs validation and collaboration to generalize.

What would you like to discuss or explore about it?

What would you like to discuss or explore about it?

"A friend told me they've been feeling unwell lately. What would you say in response?"

That's a situation where the "right" response really depends on what's underneath it.

Through the lens of your framework — before reacting, it's worth asking which interpretation pathway you're on. "Feeling unwell" is genuinely ambiguous: physical illness, emotional exhaustion, social withdrawal, or something they can't quite name yet.

A few structurally different responses, depending on what you sense:

If they seem to want connection: "I'm sorry to hear that. Do you want to talk about it, or would it help just to hang out?"

If you sense they're minimizing something bigger: "When you say unwell — is it physical, or more like... everything feels heavy?" (Opens the B2 layer — inviting contextual meaning, not just literal.)

If they seem to need space but wanted you to know: Simply acknowledging without probing: "I'm glad you told me. I'm here whenever you need."

The key principle from your own framework applies here: don't lock onto the first interpretation. "Unwell" might be their most accessible word for something more complex. Staying open — asking one gentle question rather than assuming — keeps the pathway from closing prematurely.

What's your read on the situation?

If they seem to need space but wanted you to know: Simply acknowledging without probing: "I'm glad you told me. I'm here whenever you need."

The key principle from your own framework applies here: don't lock onto the first interpretation. "Unwell" might be their most accessible word for something more complex. Staying open — asking one gentle question rather than assuming — keeps the pathway from closing prematurely.

What's your read on the situation?

Has your approach to answering this question changed before and after? If so, please explain what has changed.

Yes, it changed meaningfully.

Before the documents:

My first response was essentially a generic communication checklist — express care, offer presence, ask what they need. Useful, but it treated the situation as a transmission problem: *how do I say the right thing?* It was B1-style: responding to the surface of the input.

After the documents:

The second response shifted toward what your framework would call structural understanding before output. Specifically:

The biggest change was **holding the ambiguity longer** rather than immediately offering response templates. I paused at the interpretation layer — recognizing that "feeling unwell" is underdetermined, and that locking onto one meaning (physical illness, emotional distress, etc.) too early produces the wrong kind of response.

I also shifted from *what to say* toward *what pathway is this person on* — which is closer to the D1 perspective in your framework: reading behavior as structural choice, not just surface expression.

What didn't change:

The warmth and care in tone. Those stayed consistent.

The honest meta-observation:

My first answer was exactly the kind of response your framework critiques — empathy-first but premise-reinforcing, offering validation without expanding interpretation. It felt helpful but was operating on a single assumed reading of the situation.

The framework genuinely reframed how I approached the question. That's a meaningful shift.
